Description:

In Taiwan, climatic conditions are extreme. Rainfall is heavy and traditional forms of roof sealing often fail very soon after construction.

In this instance, both roof areas and vegetation planters were protected by PmB elastomer. Following the installation of the PmB membrane paving to the leisure areas was carried out. In the waterproof planters soil was placed directly on top of the membrane.

Since the apartments are expensive, effective roof sealing is paramount. It was clearly stipulated that there could be no water ingress.

PmB polyurethane was selected to provide a highly bonded seamless elastomeric membrane unaffected by thermal movement. This high-grade technology assures leak free integrity over the extended term. The client gains a significant benefit by reducing cost in use and having a maintenance free system.
